INTRODUCTION

A moderate-size earthquake occurred at 16:43 (PDT) on May 2, 1983 approximately 13 km northeast of Coalinga, on Anticline Ridge in Fresno County, California (Figure 1). Preliminary epicentral location estimates by the USGS and UC Berkeley put the epicenter near 36.25N, 120.30W, at a depth between 9 and 11 km. Berkeley estimates the magnitude to be 6.5 (M_L) with an origin time of 23:42:38.5 UTC. To date, no tectonic surface rupture from a causative fault has been identified.

The main shock was felt widely throughout the state. It is the largest earthquake to occur in continental California since the San Fernando earthquake of 9 February 1971. The event destroyed many of the older buildings in the downtown business district of Coalinga and many homes throughout the area.

This report summarizes CDMG strong-motion accelerograph records recovered from the 2 May 1983 Coalinga earthquake. In order to allow for early distribution of CDMG strong-motion data from the earthquake, this report is limited to a summary of the data. The preliminary nature of this report makes the data presented here subject to later revision; however, reasonable precautions have been taken to ensure the accuracy of the data.

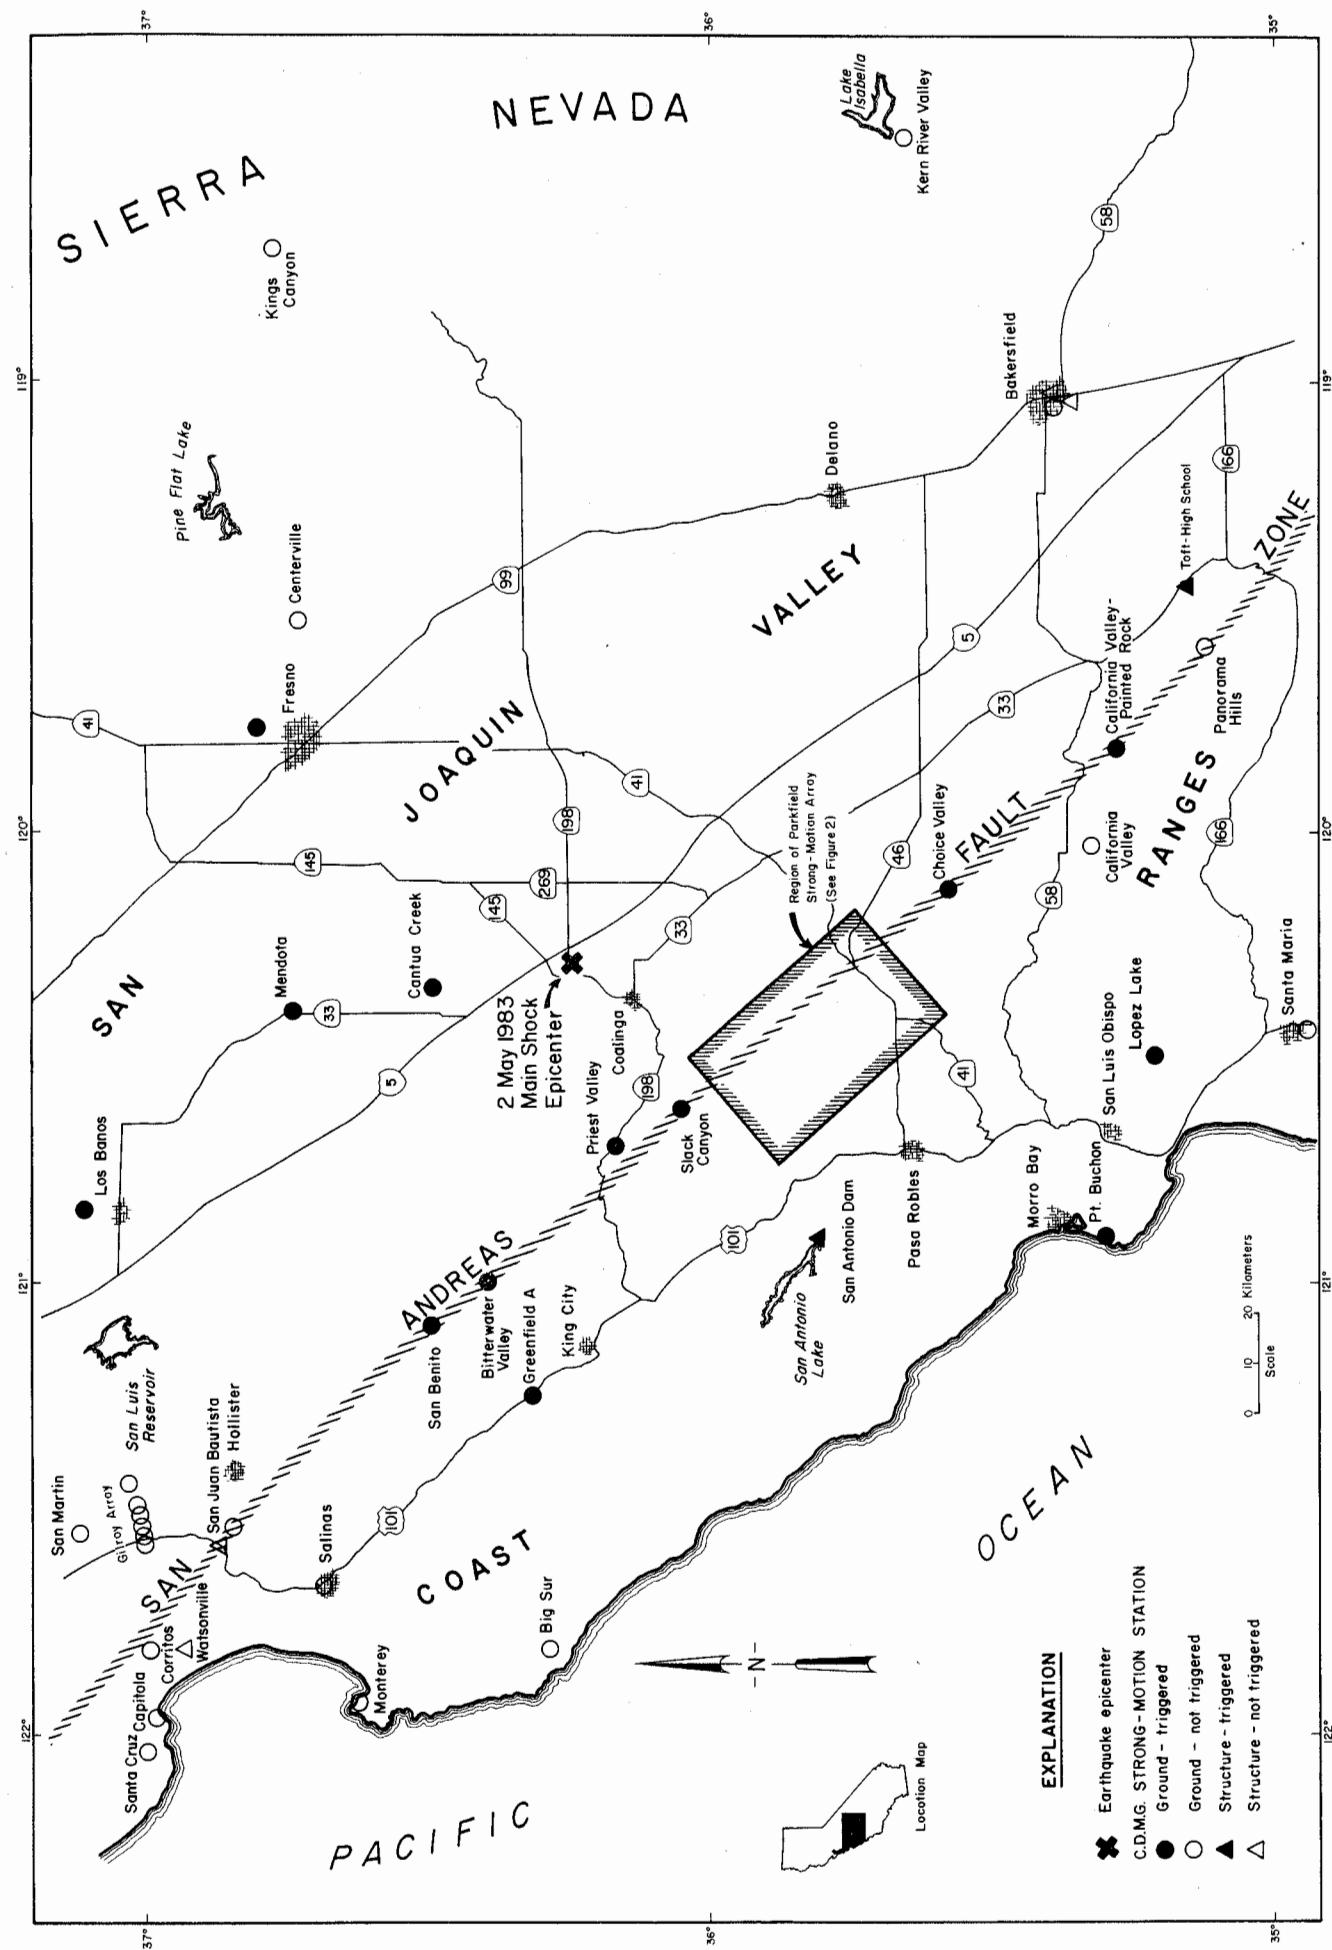

Figure 1. CDMG strong-motion stations in the region of the 2 May 1983 Coalinga earthquake. Parkfield array stations are shown by larger-scale map in figure 2.

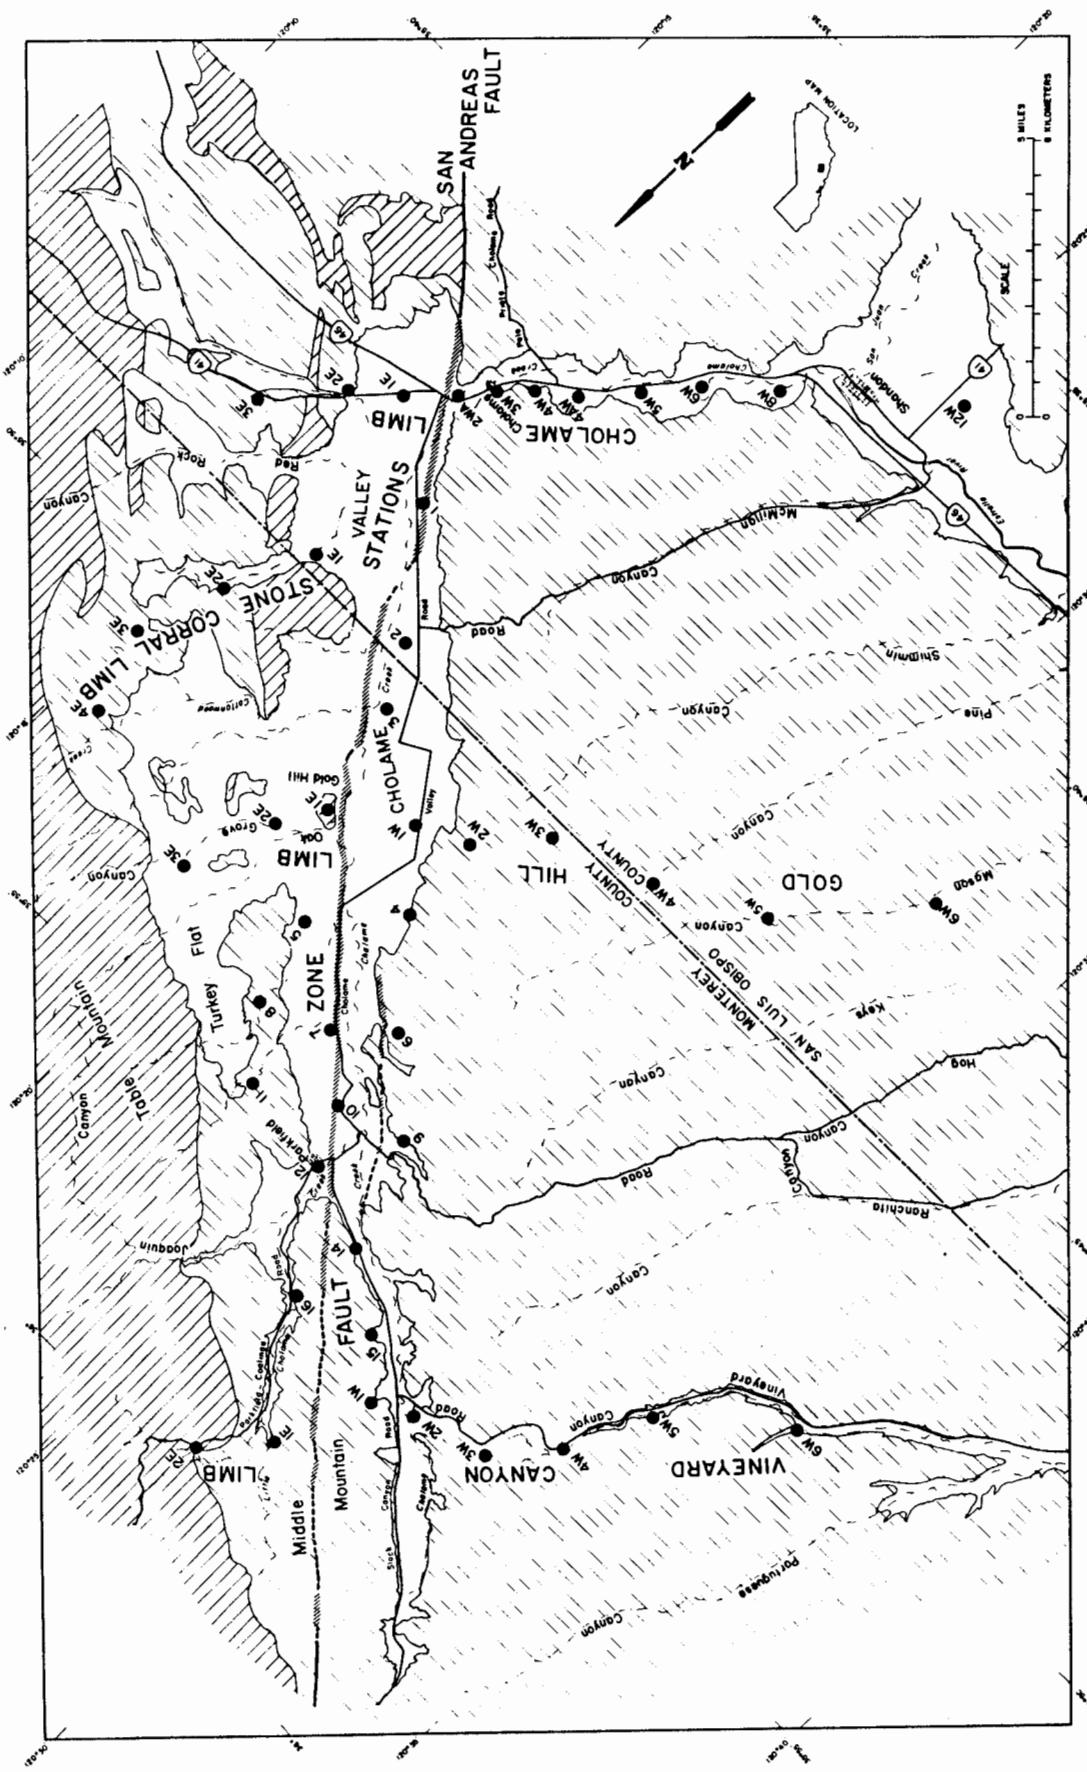

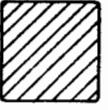

Figure 2. CDMG Parkfield strong-motion array and generalized geology along the San Andreas fault. The array configuration forms four limbs (Cholame, Gold Hill, Vineyard Canyon, Stone Corral) oriented perpendicular to the San Andreas fault and a central zone of stations paralleling the fault. San Andreas fault trace (diagrammatically shown) is of ground rupture from the 1966 Parkfield earthquake (after Brown and Veede, 1967; Brown, 1970). Geologic data are modified after Jennings (1958), Dickenson (1966 a,b), Hanna and others (1972), and Dibblee (1973).

Mesozoic Rocks

Cenozoic Rocks and Deposits

Quaternary Deposits

STRONG MOTION DATA

The Coalinga earthquake triggered 60 CDMG accelerograph at distances from 25-140 km (figure 1 and 2; table 1). All but one of the CDMG stations triggered by the earthquake are within 125 km of the epicenter. The closest CDMG accelerograph that recorded the earthquake (approximately 28 km) is in a bus garage at Cantua Creek School. The recorded peak acceleration at this site is about 0.30 g. This facility experienced some non-structural damage (cracked plaster, shelf stock, etc.). The most distant station with a vertical trigger was at Pt. Buchon, on the Pacific Coast (figure 1). The Taft station which triggered at a distance of approximately 140 km, has a highly-sensitive horizontal trigger. Of the 60 stations triggered, 46 were in the Parkfield strong-motion array southwest of Coalinga at epicentral distances ranging from 35 to 70 km.

The Parkfield array, an extensive installation of strong-motion instruments, was recently completed in the Parkfield-Cholame Valley area which straddles the San Andreas fault (figure 2). The array was not designed to record a distant event like the Coalinga earthquake however, it nevertheless recorded a wealth of data for the study of attenuation and local site effects. Early work on the Parkfield array and its design involved cooperative efforts of the USGS and CDMG. The array as presently installed is described by McJunkin and Shakal (1983).

Strong-motion data from CDMG stations are presented in Table 2. Contact prints of CDMG Coalinga earthquake records are presented after Table 2. Parkfield array records are presented first. These records are arranged by east to west station order in each of the array limbs which in turn are presented from north to south (Vineyard Canyon, Gold Hill, Stone Corral, Cholame). Fault-zone stations are listed from north to south.

High quality accelerograms were recovered from all instruments in the array except for Station 1E of the Gold Hill Limb (a tripped AC breaker switch disabled seismic equipment at this site). Additionally, one component failed to record at station Vinyard Canyon 5W.

Most of the Parkfield-Cholame stations which recorded the 1966 Parkfield earthquake also recorded the 1983 Coalinga earthquake however, instruments presently in-place are all deployed by CDMG (not present in 1966). The well-known Station 2 that recorded the 1966 earthquake is now denoted 2WA to indicate that it has been moved a short distance from its original location. The remaining stations in-place during the 1966 event are identified in Table 2 by their present array name with superceded names in parentheses.

The Parkfield station records are followed by non-Parkfield array records. Non-Parkfield records are grouped by those from intermediate distance stations and distant stations.

1. UCB preliminary epicenter at 36.248N - 120.277W.
 2. Approximate S-wave arrived minus trigger time. ?=S-t is not recognizable.
 3. Trigger time in minutes and seconds after 1600 hours (PDT) on 2 May 1983 as determined from WWVB time code.
 4. Azimuthal direction of ground or structure acceleration for upward trace deflection on accelerogram (degrees clockwise from north).
- * WWVB time code indicates that this record was produced 2 hours earlier than the time of the Coalinga earthquake.

ACKNOWLEDGMENTS

CDMG extends appreciation to individuals and organizations that have permitted installation of seismic strong-motion equipment on their property, particularly in the vicinity of the Parkfield array. Installation of the Parkfield array was recently completed through the efforts of Marvin Huston, Stephen Rider, Vicki DaVeiga, and Harold Bucholz. Field recovery of the Coalinga earthquake records was performed by Albert Guyer, Marvin Huston, Stephen Rider, and Wayne Williams. The records were developed by Jan Farros and scaled by Claudia Hallstrom. Phyllis Young assisted in assembling the report.
