INTRODUCTION

This report summarizes non-fuel mineral production in California in 2022. California is one of the largest producers of non-fuel minerals in the United States. Non-fuel minerals comprise a variety of commodities produced by mining, but exclude fuel commodities like coal and oil shale. In addition to 2022 production data, this report includes figures showing production from 1991 to 2022 for a select number of commodities. The data used to produce the figures is included as the appendix. In cases where a small number of mines produce a specific commodity, production data are withheld to protect proprietary company information. Production data made available to the public by the mining company are not considered proprietary. For this report, production is defined as the weight of the commodity sold, reported as short tons or troy ounces.

Data used in this report are primarily from the California Department of Conservation's Division of Mine Reclamation (DMR) and the United States Geological Survey (USGS). DMR data consist of production data from 1991 to 2022. USGS data consist of 2022 production values for several individual commodities, purposely grouped production values where individual commodity results are concealed to protect unpublished data, and unit prices for gold and silver. Additional production data come from mining companies.

Mines regulated under the Surface Mining and Reclamation Act of 1975 (SMARA, Public Resources Code, Sections 2710-2796) are required to report production annually. In general, mines that will remove at least 1,000 cubic yards of overburden or mineral product, or disturb at least one acre of land, are regulated by SMARA. Since not every small mining operation is regulated by SMARA, there may be a minor amount of production not accounted for in this report.

Based on data from the DMR, 634 mines reported production greater than zero. Figure 1 shows the number of producing mines from 1991 to 2022. Thirty-four non-fuel mineral commodities were reported to the DMR. These commodities are divided into the following three categories for this report based on the California State Mining and Geology Board (SMGB) Guidelines for Classification and Designation of Mineral Lands (SMGB, 2000):

- Construction materials
- Industrial and chemical mineral materials
- Metallic and rare minerals

Prior to the Non-Fuel Mineral Production 2018 report, the California Geological Survey (CGS) Annual Non-Fuel Mineral Production reports were based mostly on data provided by the USGS. The USGS data included production data and unit prices for either the mined mineral (e.g., limestone) or an end-use commodity (e.g., cement) and are based on mine operator surveys. For years 2018 and 2019, national average commodity unit prices published by the USGS were available, but production data for California were not (except for cement clinker). For years 2020 through 2022, USGS production and unit prices were made available for several commodities. Because commodities

reported to the DMR and USGS do not match in many cases, CGS cannot compare data reported to the DMR with past annual non-fuel reports based on the USGS data.

Figure 1. Number of producing mines from 1991 to 2022

PRODUCTION VALUE SUMMARY

Using a combination of data from DMR, USGS, and MP Materials, the total estimated California non-fuel mineral production value was \$5.5 billion in 2022. Figure 2 is a production value summary chart. It shows the production values for some individual commodities and, where required to protect unpublished USGS data, a group of commodities.

Based on USGS preliminary data, California ranked fourth—behind Arizona, Nevada, and Texas—in non-fuel mineral production value, accounting for approximately 5.71 percent of the nation's total (USGS, 2023). Below is California's national production value ranking for commodities where production was ranked by state and California was mentioned in the commodity summary (USGS, 2023):

- Boron: First
- Construction sand and gravel: First
- Gypsum: First
- Rare earth elements: First
- Cement: Third
- Gemstones: Fourth
- Crushed stone: Ninth
- Industrial sand and gravel: Ninth

California Non-Fuel Mineral Production 2022

Total Value \$5.5 Billion

Figure 2. Production value summary chart

PRODUCTION BY MINERAL CATEGORY

Construction Materials

In 2022, construction materials included nine commodities produced by 537 mines. Table 1 summarizes the commodities and production.

Table 1. Construction materials 2022 production summary

| Commodity | Number of Mines | Production (short tons) |
|---------------------------|------------------------|--------------------------------|
| Cinders | 13 | 137,303 |
| Decomposed Granite | 41 | 1,240,208 |
| Decorative Rock | 20 | 225,826 |
| Dimension Stone | 3 | 2,240,295 |
| Fill Dirt | 23 | 1,004,373 |
| Pumice | 4 | 140,739 |
| Rock | 30 | 1,951,957 |
| Sand and Gravel | 349 | 116,152,913 |
| Stone | 54 | 11,338,188 |

Sand and gravel is produced throughout the state and comprises the majority of construction materials production. California led the nation in the production value of construction sand and gravel at approximately \$1.48 billion (USGS, 2023; USGS, 2024a). Sand and gravel production was 116 million short tons from 349 mines. Figure 3 shows the relative density of sand and gravel mines throughout the state. Figure 4 shows sand and gravel production from 1991 to 2022.

Figure 5 shows the production of construction materials other than sand and gravel from 1991 to 2022. Data for individual commodities before 1996 were not included to protect proprietary information. Figure 6 shows where these commodities, other than sand and gravel, were produced as the primary commodity in 2022.

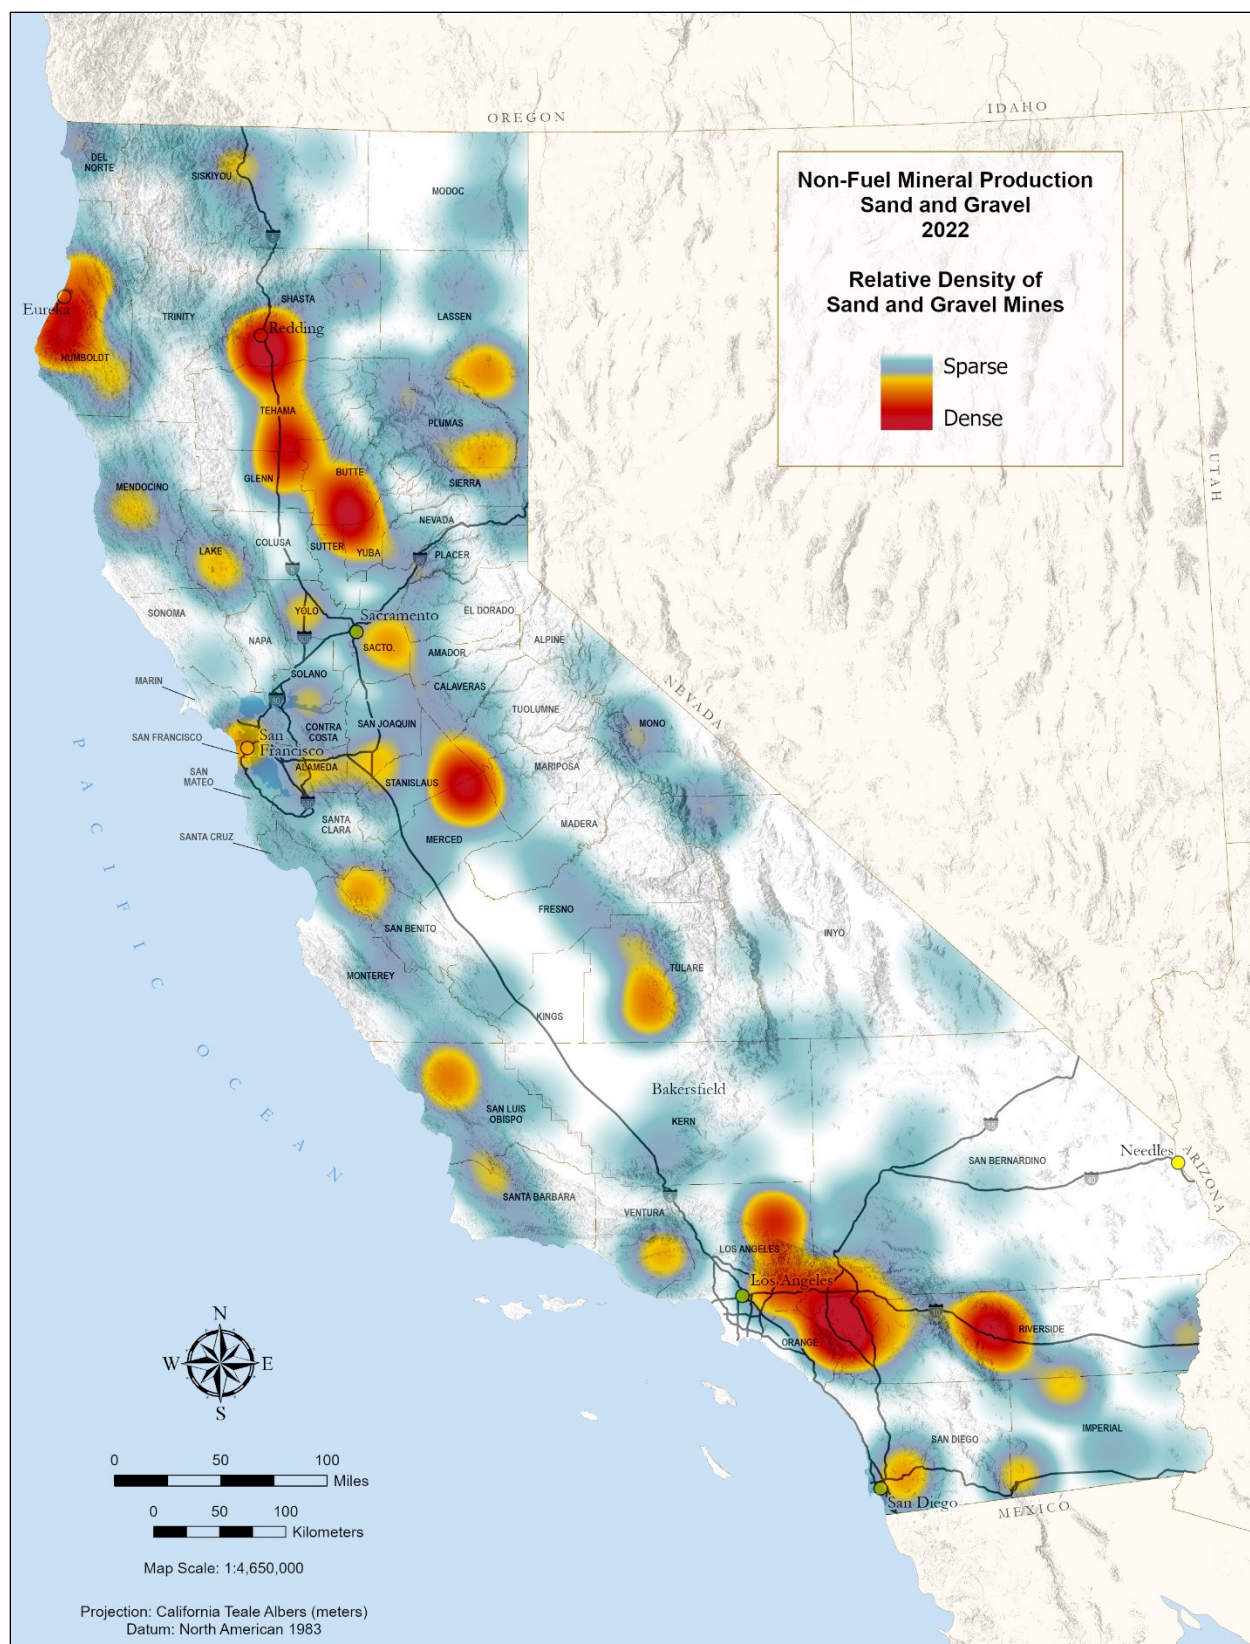

Figure 3. Sand and gravel relative density of mines 2022

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

Figure 4. Sand and gravel production from 1991 to 2022

Figure 5. Construction materials (excluding sand and gravel) production from 1991 to 2022

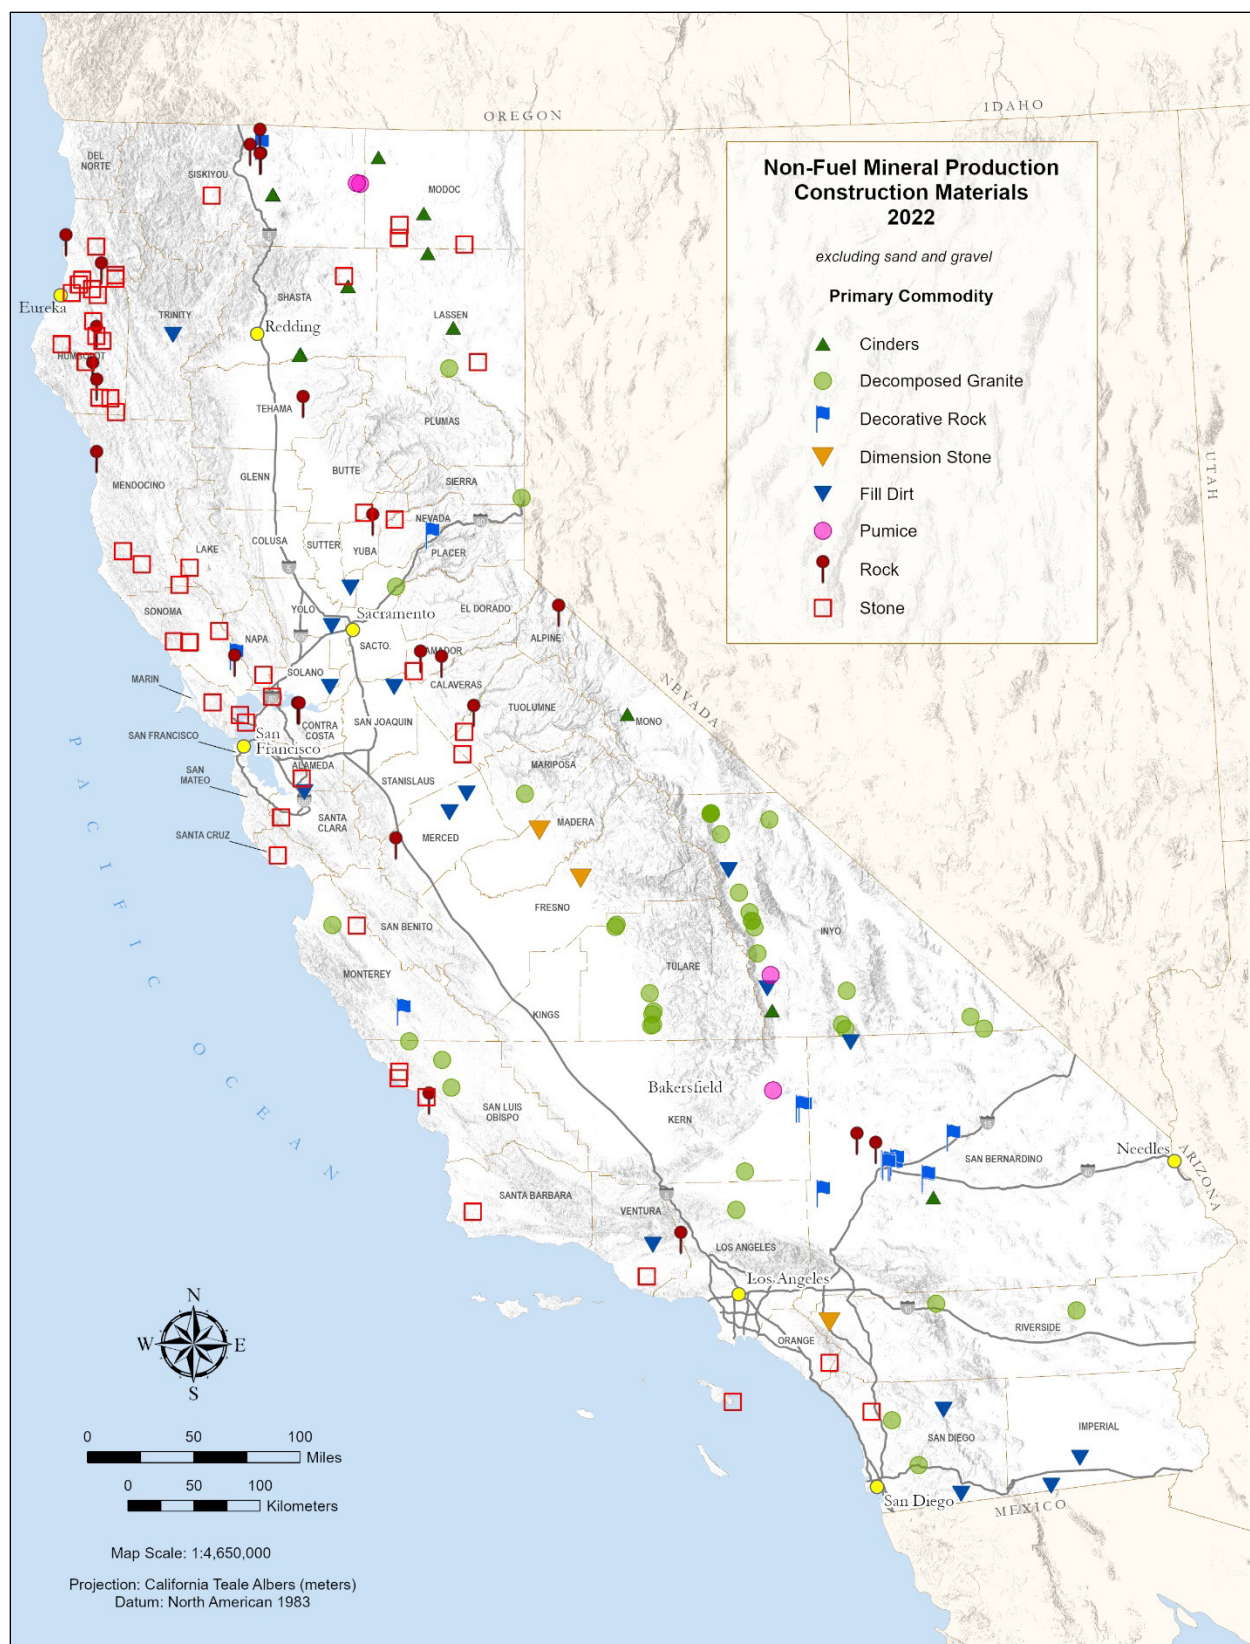

Figure 6. Construction materials (excluding sand and gravel) 2022 production locations

Industrial and Chemical Mineral Materials

In 2022, industrial and chemical mineral materials included 19 commodities produced by 116 mines. Table 2 summarizes these commodities and the associated production. Figure 7 shows where these commodities were produced as the primary commodity.

Table 2. Industrial and chemical materials 2022 production summary

| Commodity | Number of Mines | Production (short tons) |
|-------------------------|-----------------|-------------------------|
| Abrasives | 2 | W |
| Borates | 2 | W |
| Clay | 26 | 648,984 |
| Diatomite | 3 | 368,181 |
| Dolomite | 3 | 376,927 |
| Feldspar | 1 | W |
| Gypsum | 5 | 1,403,769 |
| Kyanite | 1 | W |
| Lime | 1 | W |
| Limestone | 29 | 18,458,016 |
| Perlite | 1 | W |
| Saline Compounds | 4 | 1,174,278 |
| Salt | 3 | 265,180 |
| Sea Shells | 1 | W |
| Shale | 19 | 608,225 |
| Silica | 2 | W |
| Specialty Sand | 9 | 1,063,986 |
| Talc | 1 | W |
| Zeolites | 3 | 17,682 |

W = Production withheld to protect proprietary information

Limestone production was 18.5 million short tons from 29 mines. Most of the limestone produced in California is used for the manufacture of cement, with the remainder produced as crushed rock (a construction material) and as specialty products.

The amount of limestone used to manufacture cement is not reported to the DMR; however, according to USGS industry surveys, California portland cement production was 9.81 million short tons (USGS, 2024a). The value of portland cement was approximately \$1.12 billion (USGS, 2024a). Figure 8 shows limestone production from 1991 to 2022.

Gypsum production was 1.40 short tons from five mines. The value of gypsum was approximately \$18.6 million (USGS, 2024a). Figure 9 shows gypsum production from 1991 to 2022. Gypsum is most commonly used for wallboard, agriculture (as a soil amendment), and in the manufacture of portland cement.

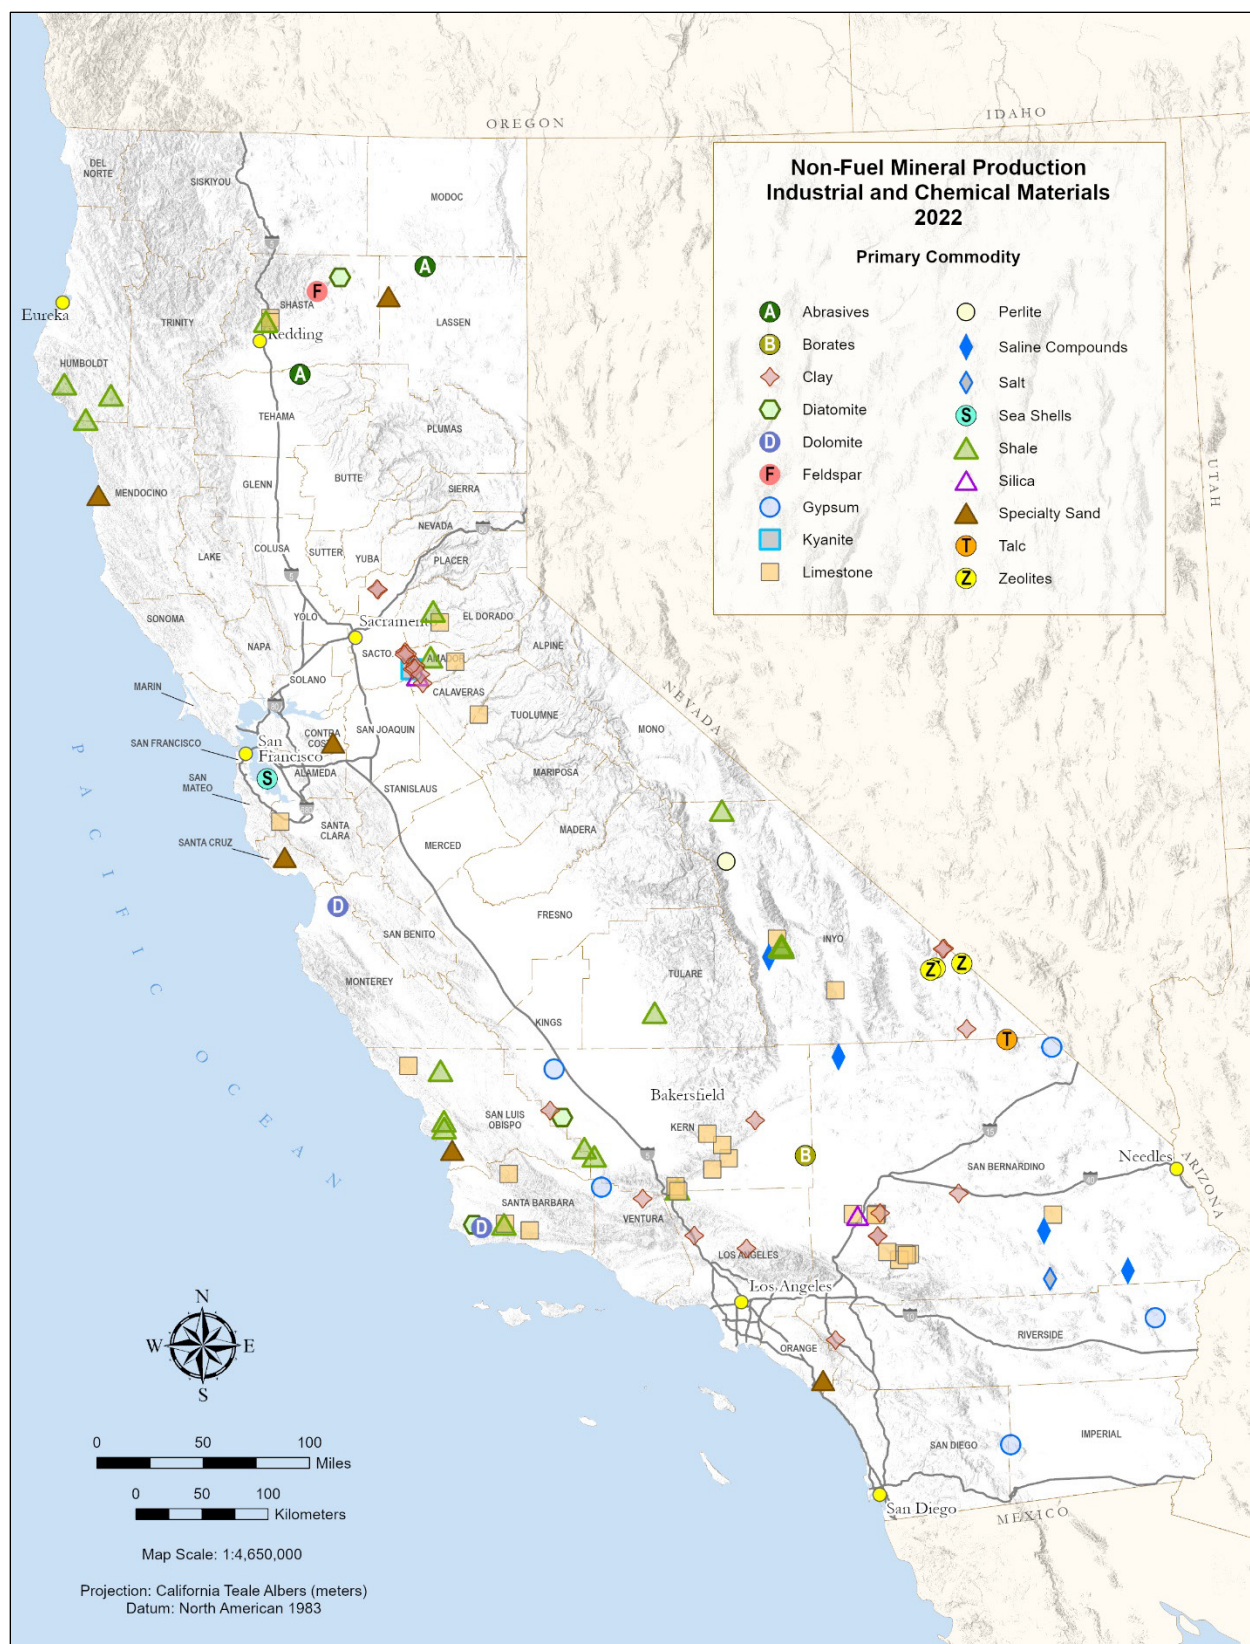

Figure 7. Industrial and chemical materials 2022 production locations

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

Figure 8. Limestone production from 1991 to 2022

Figure 9. Gypsum production from 1991 to 2022

Clay production was 649 thousand short tons from 26 mines. Clay uses include ceramics, cement production, absorbents, drilling fluid components, landfill liners, and others. Figure 10 shows clay production from 1991 to 2022.

Specialty sand production was 1.06 million short tons from nine mines. Specialty sands are used for applications other than aggregate, including golf course sand traps,

beach volleyball courts, and many others. Figure 11 shows specialty sand production from 1991 to 2022.

Borates were produced by two mines including U.S. Borax's Boron Pit, the largest open-pit mine in California (U.S. Borax, 2023). The element boron is used in a wide range of products including fiberglass insulation, ceramics, high strength glass, agriculture, fire retardants, detergents, advanced composite materials, and insecticides.

Figure 10. Clay production from 1991 to 2022

Figure 11. Specialty sand production from 1991 to 2022

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

Metallic and Rare Minerals

In 2022, metallic and rare minerals included six commodities produced by 39 mines. Table 3 summarizes the commodities and production. Figure 12 shows where these commodities were produced as the primary commodity.

Table 3. Metallic and rare minerals 2022 production summary

| Commodity | Number of Mines | Production |
|----------------------------|------------------------|--------------------|
| Gemstones | 1 | W |
| Gold (Lode) | 6 | 195,420 ounces |
| Gold (Placer) | 18 | 4,607 ounces |
| Iron Ore | 5 | 513,277 short tons |
| Rare Earth Elements | 1 | 42,499 short tons* |
| Silver | 8 | 510,392 ounces |

W = Production withheld to protect proprietary information

* Production of rare earth oxides as reported in MP Materials Reports Fourth Quarter and Full Year 2022 Results (MP Materials, 2023)

Gold production (lode and placer) was 200 thousand troy ounces (ounces) from 24 mines, representing an 8.02 percent production decrease from 2021. The estimated value was \$360 million based on an average price of \$1,802 per ounce (USGS, 2024b). The Western Mesquite Mine, an open-pit heap-leach mine in Imperial County, led California in gold production with 123,965 ounces (Equinox Gold Corp., 2023). Nine mines (six lode and three placer) reported gold as the primary commodity. Fifteen mines producing construction or industrial minerals as the primary commodity produced gold as a secondary commodity. Those mines accounted for 1.9 percent of gold production. Figure 13 shows gold production from 1991 to 2022.

Silver production was 510 thousand ounces from eight mines, representing a 25.7 percent decrease from 2020. The estimated value was \$11.2 million, based on an average price of \$21.88 per ounce (USGS, 2024b). All mines that reported silver production also reported gold production. Figure 14 shows silver production from 1991 to 2022.

Iron ore production was 513 thousand short tons from five mines. Iron ore produced in California is predominantly used in the manufacture of cement.

Rare earth elements were produced at the Mountain Pass Mine in San Bernardino County. The mining company, MP Materials, reported production of 42,499 short tons of rare earth oxides with product sales of \$528 million in 2022 (MP Materials, 2023). Rare earth elements are a group of 15 individual metallic elements that are critical to modern technologies, including high-powered magnets, lasers, and solar panels.

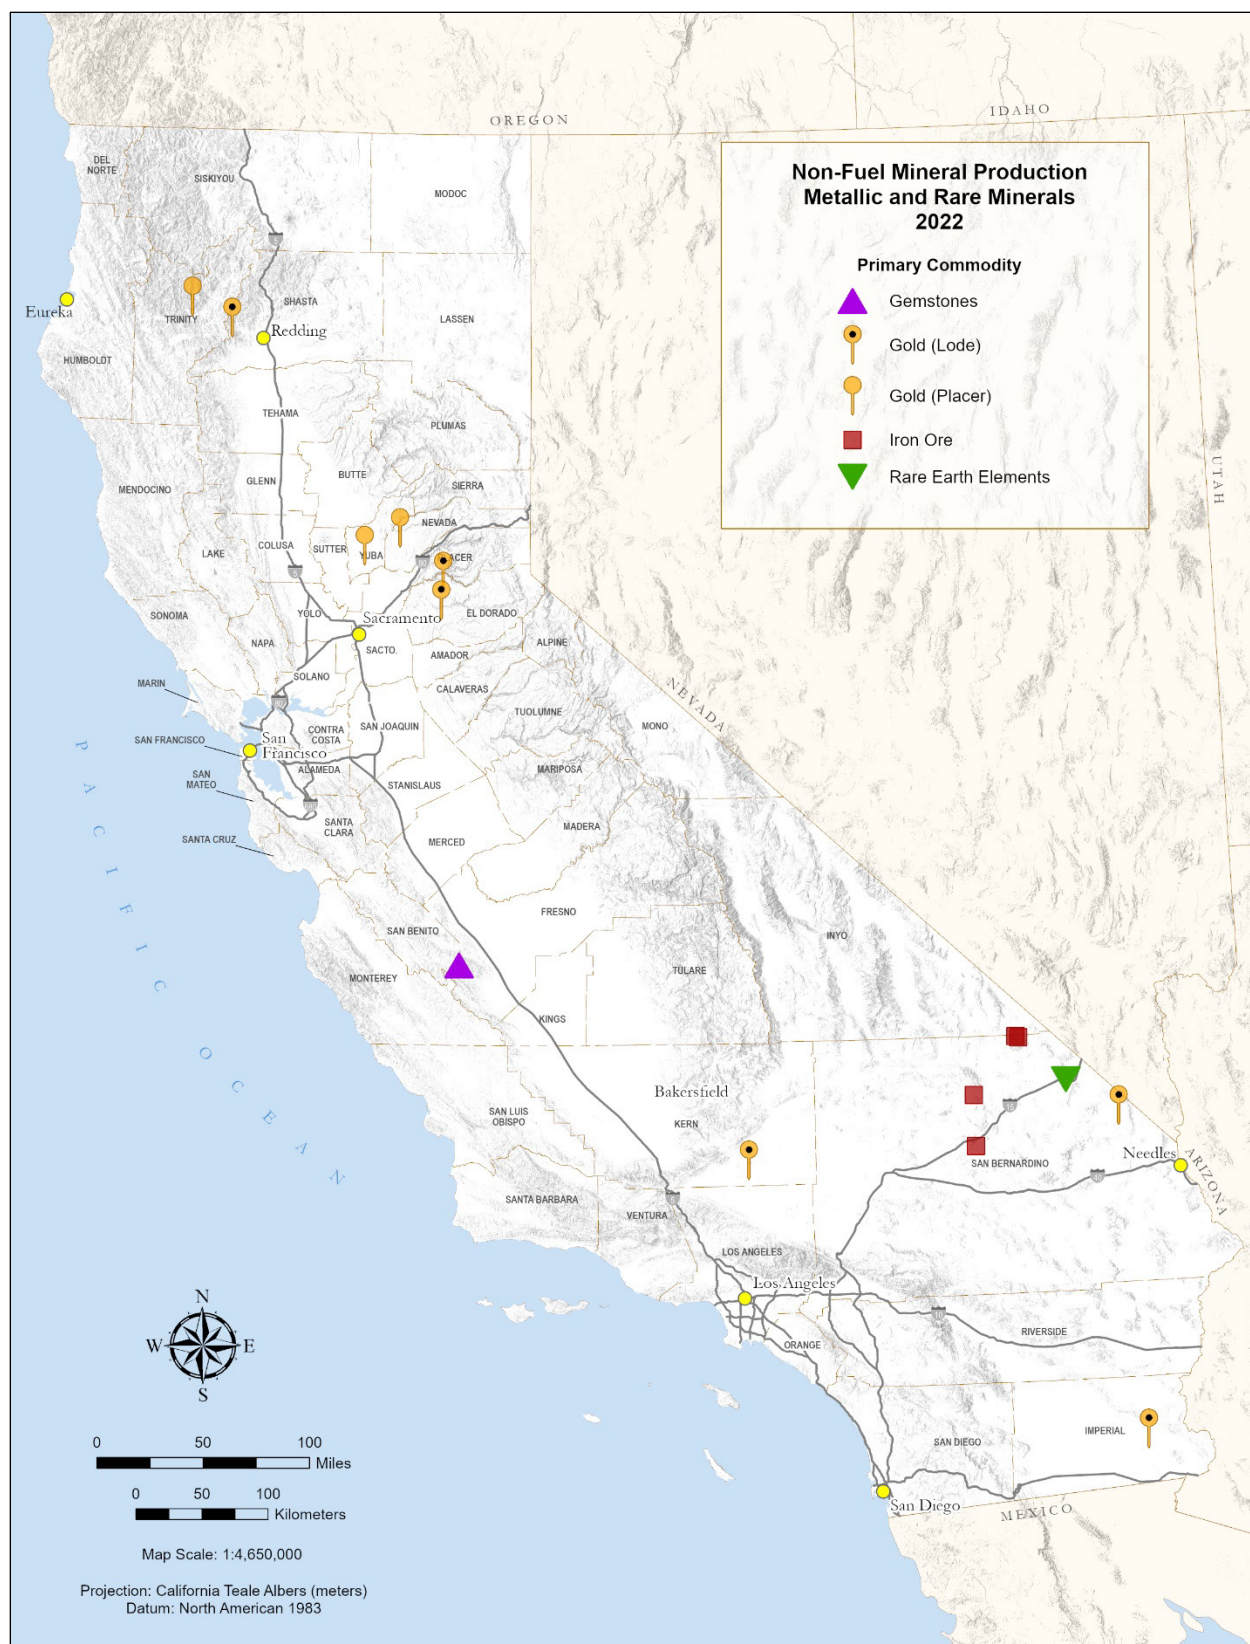

Figure 12. Metallic and rare minerals 2022 production locations

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

Figure 14. Silver production from 1991 to 2022

CURRENT EXPLORATION

There are mineral exploration projects underway in California for base metals (including copper and zinc), gold and silver, and lithium. Exploration project information, as of July 2024, was gathered from mining publications, federal land agency websites, the websites of projects discussed in previous non-fuel mineral production reports, and other sources. Below are brief summaries of current projects. Figure 15 shows the location of the exploration projects listed below.

Criteria for inclusion in the list below include the following:

- Projects must reference a specific location, such as a delineated area, claims, or a property boundary
- At least one of these actions has been taken over the last three years:
 - Exploratory drilling
 - Reanalysis of previous drilling
 - Permitting (progress made)
 - Preparation of a National Instrument 43-101 report with resource estimates

Base Metals

The Blue Moon Project is a proposed zinc-silver mine in Mariposa County, 22 miles northeast of Merced. The project contains a massive sulfide deposit that would likely be mined underground. Mineral resource estimates were updated in November 2023 and included an increase in the zinc grade and an increase in the percentage of resources in the indicated category (Blue Moon Metals, 2024).

The US Copper Corp. Moonlight-Superior and Engels Project is a proposed copper mine in Plumas County. The project includes previously mined areas of Lights Creek. The indicated resource is 1.3 billion pounds of copper. Recent drilling operations confirmed a "small oxide cap" covering the Moonlight sulfide deposit, but that resource has not yet been estimated (US Copper Corp., 2024).

Gold and Silver

The Apollo Calico Silver Project is a proposed area of silver mining in San Bernardino County. The project consists of the Waterloo and Langtry properties located in the Calico mining district. Measured and indicated silver reserves of 110 million ounces have been reported for the Waterloo property. A conditional use permit for drilling within the Waterloo property was approved by the County of San Bernardino in March 2024 (Apollo Silver, 2024).

The Dateline Resources Colosseum Gold Mine Project is a proposed gold mine at the historical Colosseum Mine in San Bernardino County. Dateline has published highlights of recent drilling results on their website (Dateline Resources, 2024).

The Gold Discovery Group, LLC is planning to conduct exploration for gold within their existing claims in Kern and San Bernardino Counties. The project area is located in the

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

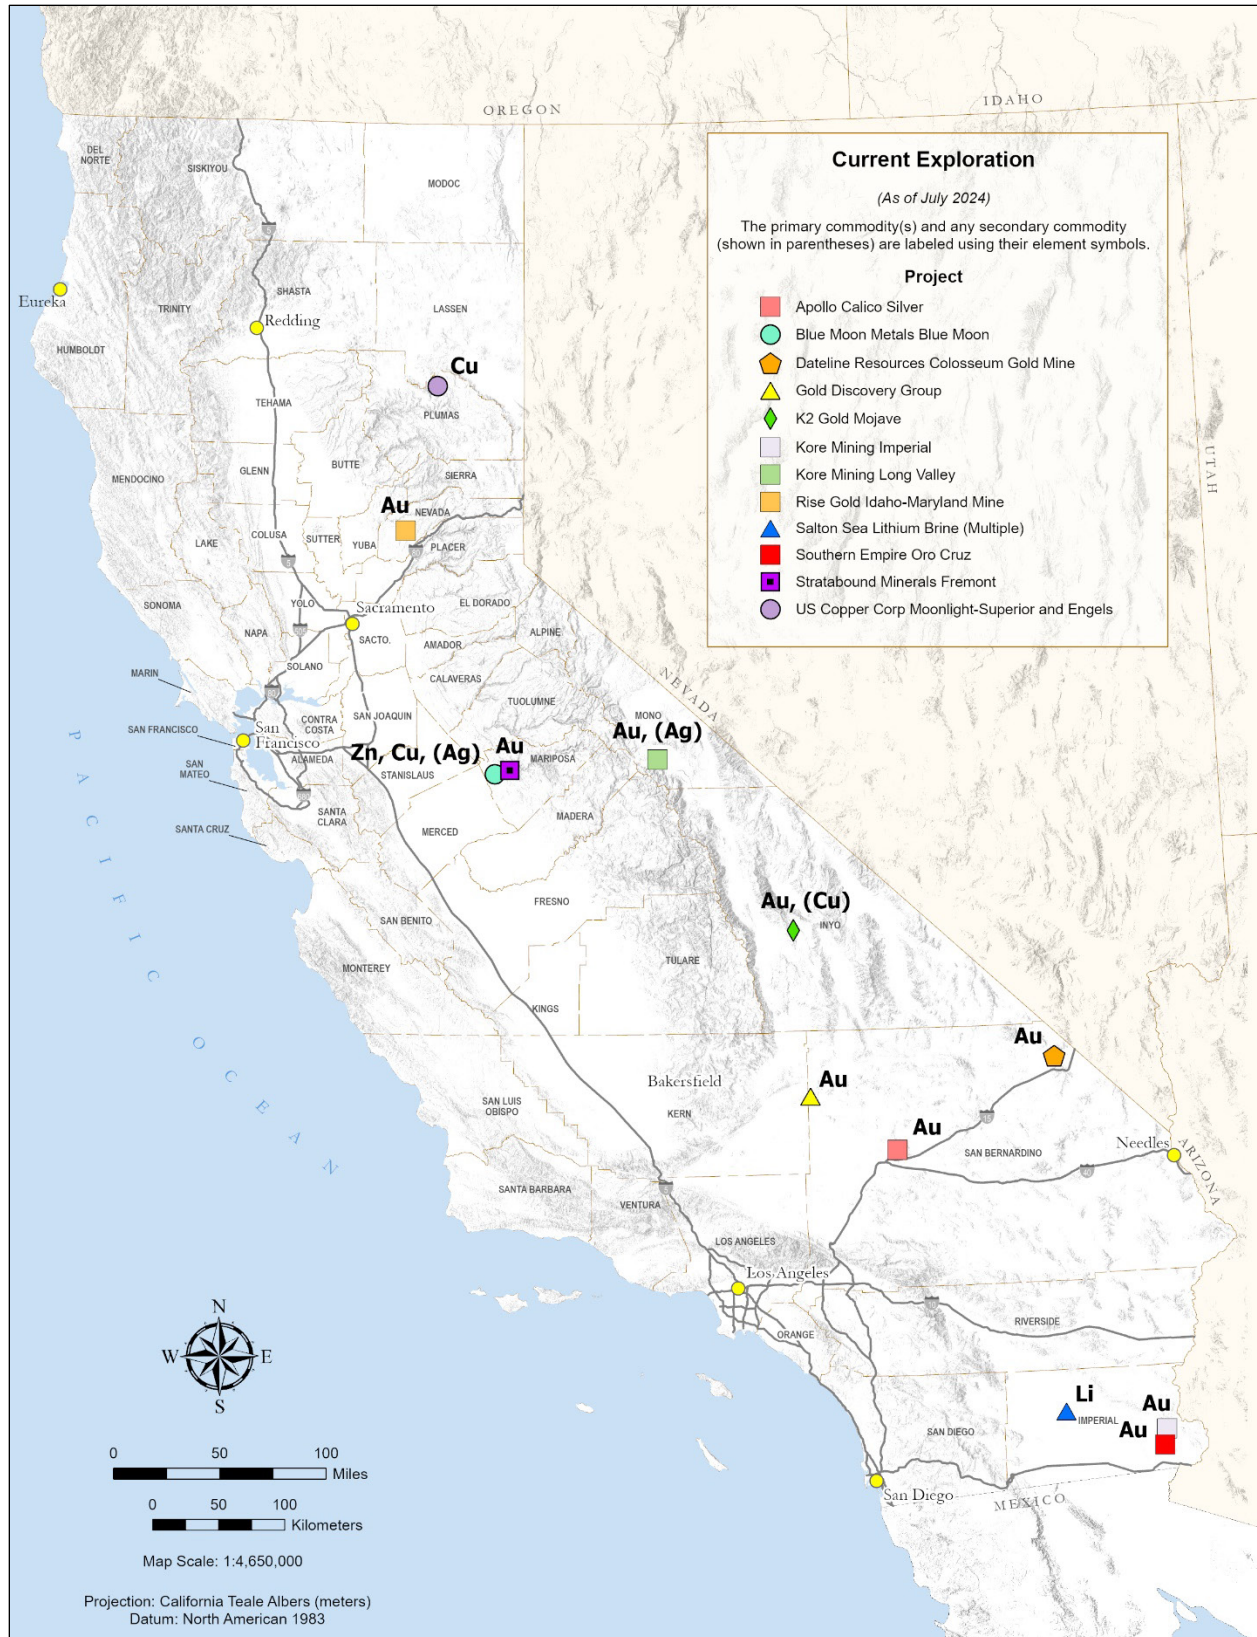

Figure 15. Current (as of July 2024) exploration projects locations

Fremont-Kramer Area of Critical Environmental Concern, north of Johannesburg. The Bureau of Land Management (BLM) approved a drilling project that allows for up to 293 shallow holes (BLM, 2023).

The Kore Mining Imperial Project consists of a 31,000 acre exploration area including a proposed open-pit heap-leach gold mine in Imperial County. The conceptual pit has indicated reserves of 900,000 ounces. (Kore Mining, 2024a).

The Kore Mining Long Valley Project is a proposed open-pit heap-leach gold and silver mine in Mono County. The project consists of a large, shallow epithermal gold and silver deposit. The project is based on existing drilling data completed before 1997 (Kore Mining, 2024b). In May 2024 a federal appeals court reversed U.S. Forest Service approval of an exploratory drilling program (Sierra Club, 2024).

The K2 Mojave Project is an area of proposed drilling targets for gold exploration in Inyo County. The project area is located south to southeast of the historical Cerro Gordo mine and ghost town. The project area also contains zones of anomalous base metals and copper. K2 is continuing to work towards permitting of a "Phase II Drill Program" (K2 Gold, 2024).

The Rise Gold Idaho-Maryland Mine Project is the proposed reopening of the historical Idaho-Maryland gold mine in Nevada County. The proposed project would be underground-only and include gravity/flotation processing of ore (Rise Gold, 2024a). In December 2023, the Nevada County Board of Supervisors adopted a resolution rejecting Rise Gold's vested rights petition. In May 2024 Rise Gold submitted a "Writ of Mandamus to the Superior Court of California for the County of Nevada asking the Court to compel the Board of Supervisors to follow applicable law and grant Rise recognition of its vested right to operate the Idaho-Maryland mine" (Rise Gold, 2024b).

The Southern Empire Oro Cruz Project is an area of gold exploration in Imperial County. The project area covers historical open-pit mines in the Cargo Muchacho Mountains including the American Girl Mine, American Boy Mine, and the Padre y Madre Mine (Southern Empire, 2024a). In March 2024 the Imperial County Board of Supervisors accepted an appeal opposing the County's Planning Commission's approval of a Mitigated Negative Declaration under the California Environmental Quality Act and a reclamation plan (Southern Empire, 2024b).

The Stratabound Minerals Fremont Project is a proposed open-pit gold mine in Mariposa County. The project area includes the historical Pine Tree-Josephine Mine. The indicated resource is 1,163,000 ounces based on data from 162 drill holes completed between 2013 to 2016 (Stratabound Minerals, 2024).

Lithium

Berkshire Hathaway Energy Renewables (BHE Renewables), which operates 10 of the 11 geothermal plants near the Salton Sea, is working toward a demonstration project to produce lithium carbonate from its geothermal brines (BHE Renewables, 2024a). In June 2024 BHE Renewables announced a joint venture with TerraLithium, a subsidiary of

CALIFORNIA NON-FUEL MINERAL PRODUCTION 2022

Occidental, for demonstration of lithium from geothermal brine extraction technologies. (BHE Renewables, 2024b).

Controlled Thermal Resources (CTR) is developing a lithium-bearing geothermal brine project in Imperial County (CTR, 2024). In January 2024 CTR broke ground at their Hell's Kitchen campus near the Salton Sea, which will be the first combined lithium extraction and geothermal plant (Desert Review, 2024).

EnergySource, which owns and operates one of the 11 geothermal powerplants near the Salton Sea in Imperial County, is working towards extracting lithium from its geothermal brines (CNBC, 2022; EnergySource Minerals, 2024).

ACKNOWLEDGEMENTS

Milton Fonseca (CGS) provided updated GIS support and map-based figures. Craig Mueller (DMR) prepared and exported production data from DMR's database.

Data for Figure 5. Construction materials (minus sand and gravel) production from 1991 to 2022

The data for Figure 5 is divided into two tables below (A and B). The value for each mineral (and the total of all construction materials) is the production in millions of short tons.

Table A

| Year | Cinders | Decomposed Granite | Decorative Rock | Dimension Stone | Fill Dirt |
|-------------|----------------|---------------------------|------------------------|------------------------|------------------|
| 1991 | W | W | W | W | W |
| 1992 | W | W | W | W | W |
| 1993 | W | W | W | W | W |
| 1994 | W | W | W | W | W |
| 1995 | W | W | W | W | W |
| 1996 | 642,048 | 1,538,246 | 151,835 | 899,340 | 1,736,086 |
| 1997 | 542,698 | 1,702,521 | 153,182 | 1,030,120 | 1,469,812 |
| 1998 | 625,045 | 2,017,775 | 163,232 | 985,734 | 2,198,925 |
| 1999 | 614,380 | 2,403,999 | 166,557 | 1,372,744 | 1,562,211 |
| 2000 | 803,015 | 2,117,677 | 189,704 | 1,538,246 | 1,355,734 |
| 2001 | 559,590 | 2,245,864 | 164,060 | 1,520,993 | 1,148,461 |
| 2002 | 682,577 | 3,207,990 | 190,617 | 784,520 | 1,950,578 |
| 2003 | 644,084 | 2,185,386 | 205,970 | 784,277 | 1,667,418 |
| 2004 | 665,206 | 2,264,334 | 236,989 | 690,677 | 1,740,773 |
