Table 6: Estimated Costs To Mitigate or Remediate the Physical and Chemical
 Hazards of Abandoned Mine Lands in California (excluding Iron Mountain)

Table 7: Watersheds with the highest potential for impacts by ARD, arsenic (As) or mercury from mercury mines (Hg) or from Placer and Hydraulic mines (Placer). The frequency of mines is given under the columns for the potential contaminant. Only the top two categories for each contaminant are shown. Data for ARD, As, and Placer derived from MRDS; data for Hg derived from DMG Mercury File. 37
