

Radon Potential Zone Map for the Palos Verdes Area, Los Angeles County, California

2012
By
Ronald K. Churchill, Ph.D.
(PG 4265)

MAP USAGE AND LIMITATIONS

This map identifies areas where geologic conditions are more likely to produce excessive indoor radon levels. The map is intended to be advisory only. It is intended to assist national, state and local governments and organizations in targeting their radon program activities and resources. This map is not intended for determining which buildings have excessive indoor radon levels. Besides geology, local variability in such factors as soil permeability, weather and climatic conditions, building design and condition, and building usage also influence indoor radon levels. Consequently, building-specific radon levels can only be determined by indoor radon testing. No warranty as to actual radon levels at specific sites is expressed or implied by this map or the accompanying report.

The U.S. Environmental Protection Agency (EPA) recommends that all homes be tested for radon whatever their geographic location. Homes with elevated radon levels have been found in all zones within the Palos Verdes area. The U.S. EPA recommends that action be taken to reduce radon in homes with an average annual level higher than four picocuries per liter (4 pCi/l).

Questions regarding this map should be directed to:

RADON ZONE DEFINITIONS

- High Potential For Indoor Radon Levels Above Four Picocuries Per Liter**
- Moderate Potential For Indoor Radon Levels Above Four Picocuries Per Liter**
- Low Potential For Indoor Radon Levels Above Four Picocuries Per Liter**
- Unknown Potential For Indoor Radon Levels Above Four Picocuries Per Liter**

** The U.S. Environmental Protection Agency (EPA) recommends four picocuries per liter as the action level for radon reduction.
